

Dr Cynthia Forlini is Senior Lecturer in Health Ethics and Professionalism in the School of Medicine (Faculty of Health) at Deakin University. Her research explores the neuroethical issues that arise as we redefine the boundaries between treatment, maintenance, and enhancement of cognitive performance. She has examined these issues conceptually and empirically as they relate to the use of neurotechnology (e.g. neuropharmaceuticals and non-invasive brain stimulation) in different contexts such as competitive academic environments, research, healthy cognitive ageing, and dementia prevention.
